*"The limits of my language mean the
limits of my world."*

LUDWIG WITTGENSTEIN

A Word & Its Structure

What is a word?

A word is the smallest **free form** found in language. Free form is an element that does not have to occur in a fixed position with respect to neighboring elements.

Example:	English	girl, bed, water
	Thai	เด็ก, บ้าน, ลิง

Root VS Base/Stem

Affix, Root, Stem, Base

???

<i>in</i>	<i>flexible</i>	<i>ity</i>
<i>in</i>	<i>flexible</i>	<i>ity</i>
<i>in</i>	<i>flexible</i>	<i>ity</i>

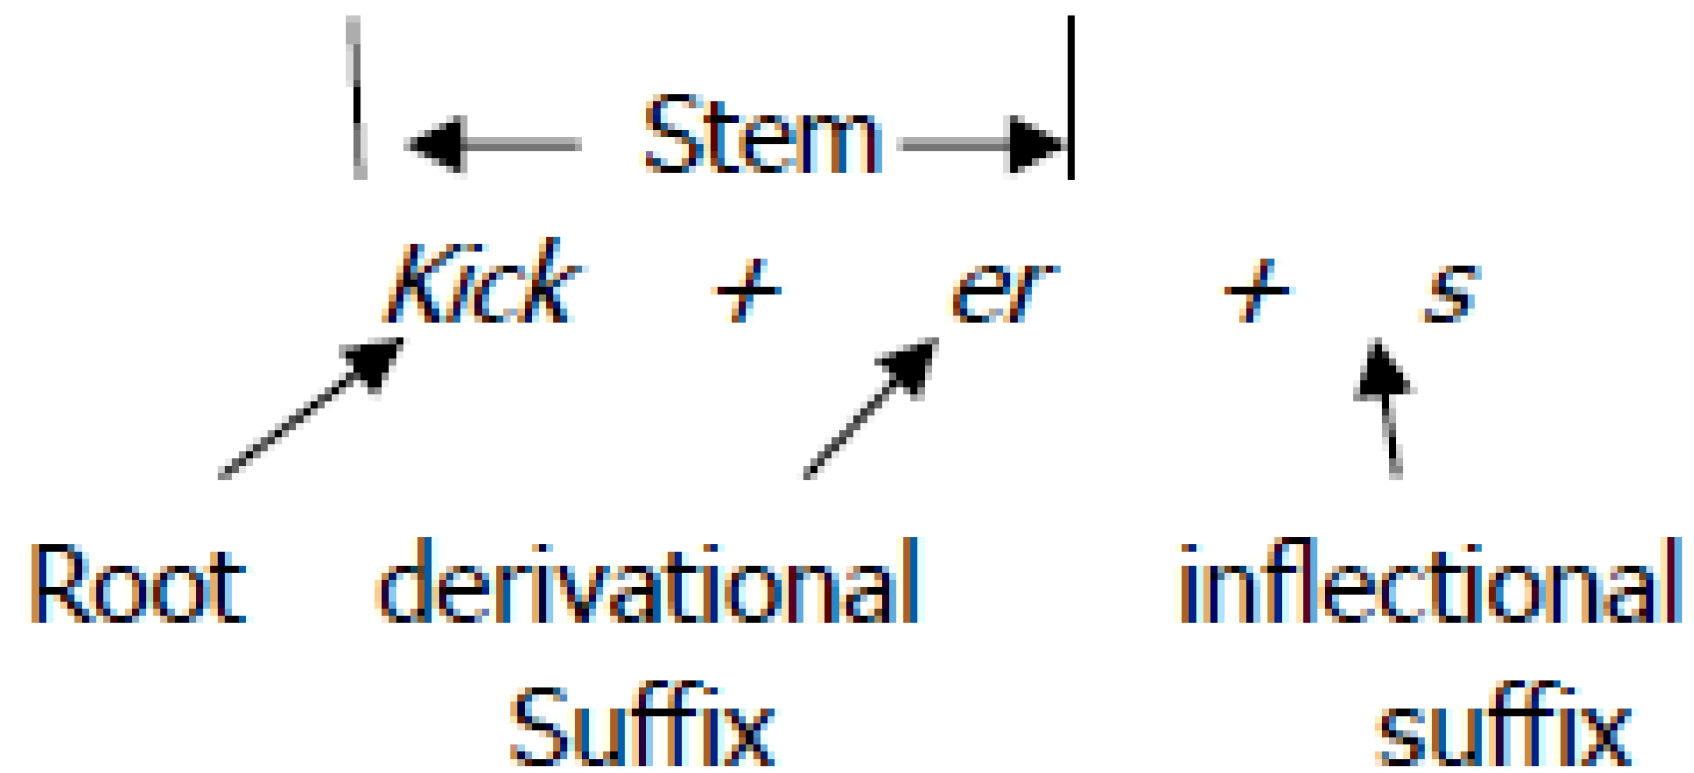

Root: the morpheme that carries the major component of the word's meaning and which belongs to a lexical category.

(1)English: “replace” is a root of “ir-**replace**-able”.

Base/Stem: any form to which can be added an affixation.

(2)English: “**replace**” is a base/stem of “**replaceable**”.

“**replaceable**” is a base/stem of “ir-**replaceable**”.

Compare Root VS Base/Stem

(1) English **brightened**:

root “**bright**” + suffix “-en” = **brighten**

base “**brighten**” + past suffix “-ed” = **brightened**

(2) Thai **มาศยงมาศ**

root “**ย**” + bound morpheme “**มาศ**” = **ยมาศ**

base “**ยมาศ**” + prefix “**มา-**” = **มาศยมาศ**

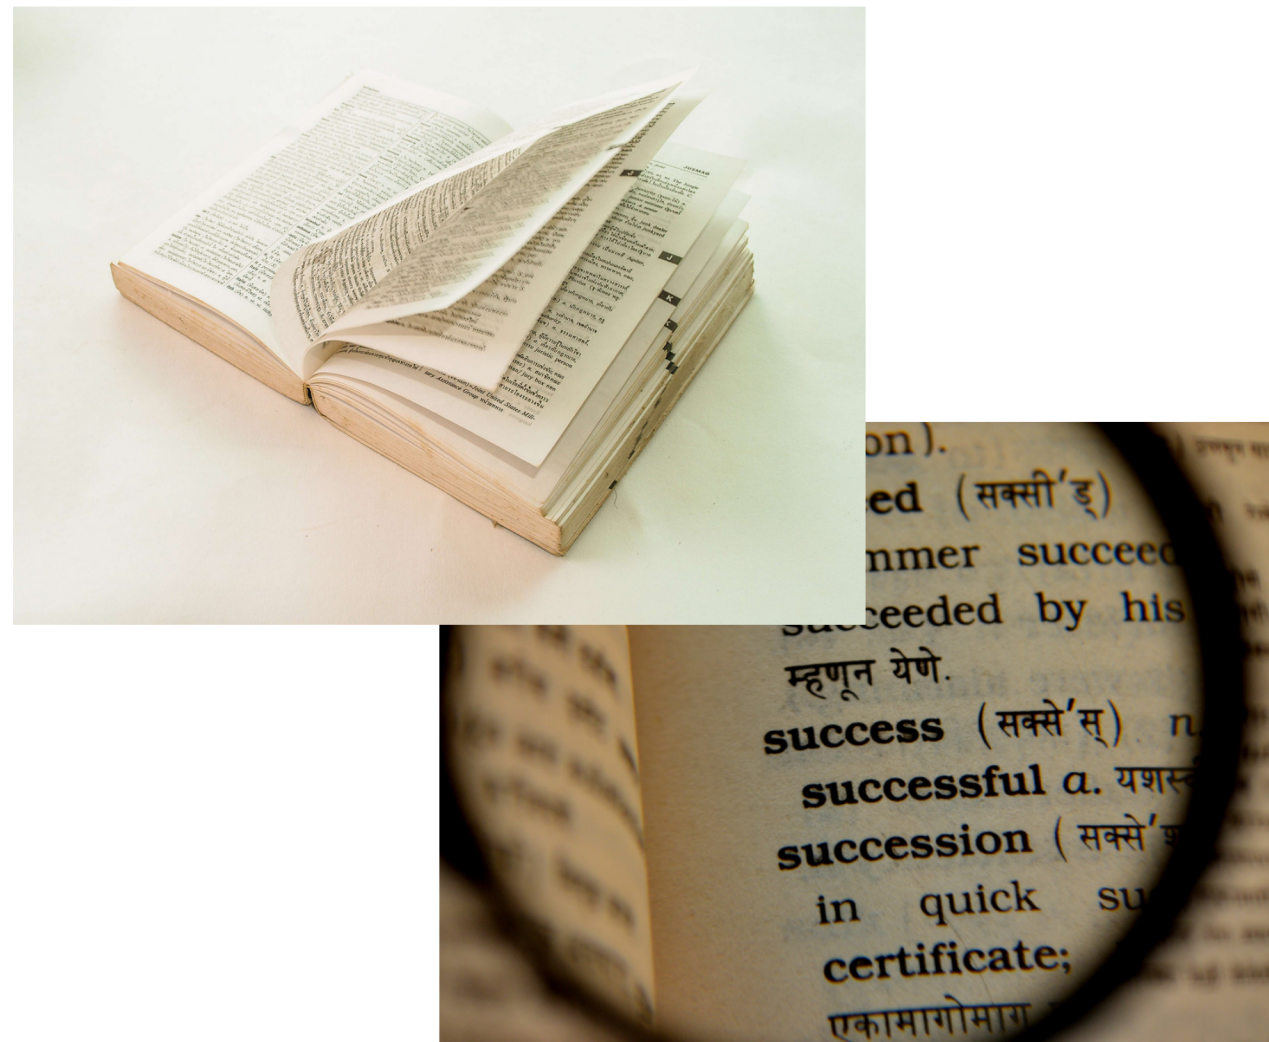

Word's Meaning is Unpredictable

A word is just a building-block of sentences with a meaning that is unpredictable.
There is no reason matching between a word and its meaning.

English land (noun): the solid part of the surface of the Earth.
(Merriam-Webster's Dictionary)

Thai แผ่นดิน (นาม) พื้นดินของโลก
(พจนานุกรม ฉบับราชบัณฑิตยสถาน)

Since the meanings of words are unpredictable,
they needed to be listed in **dictionaries**.

There are some larger words that being composed of two or more words may have a meaning that is not predictable from the meanings of the words that compose it.

Idiom: a multiword construction that is a semantic unit whose meaning cannot be deduced from the meanings of its constituents, and has a non-productive syntactic structure.

Example:

English	keep tab on = pay close attention to, monitor carefully
	bite the bullet = to get something over because it is inevitable
	break a leg = good luck
	call it a day = stop working on something

Collocation: a series of words or terms that usually co-occur. Collocations can be in a syntactic relation, lexical relation, or they can be in no linguistically defined relation.

Example:

English make decision

save the time

crystal clear

Too many cooks spoil the broth (proverb)

Word VS Lexical Items

Words are the building blocks for phrases and sentences.

Examples:

English

reads

book

compete

read

books

competitive

reading

competition

Lexical Items are words whose meanings are unpredictable, so they must be listed in dictionaries.

Example:

English read “look at and comprehend the meaning of written or printed matter.”

readable “one whose contents are interesting and entertaining, not one whose text is printed or written legibly.” Ex: Of Mice and Men is a highly readable novel.

Example

A word : dog

A lexical item:
It's raining **cats and dogs**.

Word's Structure

There are two tools for analyzing word's structure:

A dark green rounded square containing the text "Tree Diagram" in white.

Tree Diagram

A dark green rounded square containing the text "Labeled Bracketing" in white.

Labeled
Bracketing

Tree Diagram

Tree diagram: Trees can be drawn from the top-down or from the bottom-up.

Using the top down method: start with the base word label, in this case A for adjective, then split off each major division. In this case there is just one **prefix, Pf**, and an **adjective, A**. Once the parts are labeled, the word parts can be filled in underneath.

Example
One affixation: Unkind

Multiple affixation: helplessness

untouchable

Compound word: high speed

holiday car trip

Labeled Bracketing

Labeled Bracketing uses square brackets with labels in subscript. One pair of brackets corresponds to each node of the tree diagram.

A Labeled Bracketing examples:

unkind:

[A [PF un] [A kind]]

- The label A means adjective.
- The label PF means prefix.

This shows that the prefix un- attaches to an adjective, kind, to make a new adjective.

helplessness:

[N [A [V help] [Sf less]] [Sf ness]]

This shows that a suffix, -less, attaches to a verb, help, to make a new adjective, helpless. A suffix, -ness, attaches to an adjective, helpless, to make a noun, helplessness.

Mismatches Between Meaning and Structure

Nuclear physicist “someone who is an expert in nuclear physics”
; not “a physicist who is a nuclear.”

A Labeled Bracketing: [N[N nuclear] [N physicist]]

Bracketing paradox: [N[N nuclear physic] [Sf ist]]

French historian : 1. “historian who is French”
2. “an expert in French history (not necessarily a French person)”

Meaning 1: [N[N French] [N historian]]

Meaning 2: [N[N French histori-] [Sf an]]

Syllable

A syllable is a unit of organization for a sequence of speech sounds. It is typically made up of a syllable nucleus (most often a vowel) with optional initial and final margins (typically, consonants). Syllables are often considered the phonological "building blocks" of words.

C

CC-

V

-CCC

A syllable is a group of one or more sounds. The essential part of a syllable is a vowel sound (V) which may be preceded and/or followed by a consonant (C) or a cluster of consonants (CC or CCC). Some syllables consist of just one vowel sound (V) as in eye/ai/, owe/əu/.

Example

English: one syllable: boy, house, sell, strong, in, an
 two syllables: amuse, repeat, back-bone, lovely
 three syllables: landlessness, sister-in-law
 four syllables: untidiness, untruthfully
